#### ABSTRACT

This thesis implements an adaptation of the TIMPO Military Planning Game for use interactively in the Naval Postgraduate School Command, Control, and Communications (C3) Laboratory. The primary purpose of the game is to provide simulated experience in the allocation of budgetary resources for the development, propurement, and maintenance of military systems with realistic constraints of limited time and budget, and a legree of uncertainty.

Although the game is resident on the PDP 11/72 computer in the C3 Laboratory, it could be easily transported to any other similar computer system which had the same operating system.

#### **ACKNOWLEDGEMENTS**

This project would have been virtually impossible to complete without the assistance of Mr. Phil Balra and Ir. Cynthia Irvine of the Computer Science Department. When a program of this size is developed, problems and confusion are normal occurrences. Most of these can be resolved by retracing program steps or trying a different approach, but some of them require the objective eye of a disinterested party. Phil and Cynthia never hesitated to help out when I ran into problems and provide encouragement during the dark hours. I am profoundly grateful for their support.

#### I. INTRODUCTION

The Command, Control, and Communications Laboratory (C3 Lab) was conceived and developed to provide future leaders in the field with a testbed to explore ways in which computers and automated communications could improve C3 effectiveness. The project was funded by the Defense Advanced Research Projects Agency (DARPA) and the four services involved in the C3 program, and it was completed early in 1980. The first two classes in the C3 curriculum did not have the opportunity to utilize the laboratory, however, the members of the third class have had extensive experience with the capabilities resident there. courses in the curriculum are particularly rooted in the C3 Lab environment. These are Simulation and War Garing (OS 3655) and C3 Exercise Laboratory (CS 3750). It became apparent during these classes that there was a need for war gaming software to be used by the students for experience in strategic rescurce planning.

One of the most widely used strategic planning war games is the TEMPO Military Planning Game which was originally developed in the early 1960's by the Technical Military Planning Organization (TEMPO) of General Electric Company in Santa Barbara, California. Since that time it has been used by the Defense Resources Management Course at the Naval

Postgraduate School; the U.S.Army Management School at Ft. Belvoir, Virginia; the Air War College, Air Command and Staff College, and Squadron Officers' School all at Maxwell Air Force Base, Alabama. Additionally, many variations of the game have been developed and used throughout industry and the government.

Play of the game may be approached from several different perspectives ranging from simple diversion to studies of interpersonal behavior. For example, at the Defense Resources Management Course the game is focused almost exclusively on the interpersonal reactions of players. The game is administered manually with all reports and calculations done in a pencil-and-paper mode. Squadron Officers' School, heavy emphasis is placed on planning and teamwork and a mixture of computer input and manual reporting is employed. At Armed Forces Staff College, the objective of the game is quite different from the original, as implemented here, and it offers an entirely different perspective. There the game uses the same type of resource planning methodology, however, one of the more important goals is to woo a developing country through the use of foreign aid grants and military protection.

TEMPO, as implemented in the Naval Postgraduate School C3 Laboratory, is an interactive computer adaptation of the original game. It is entirely automated so the teams need not spend their time on tedious calculations and message

handling exercises. All communication with the game is conducted through computer keyboard displays and all of the timing and scoring functions are executed automatically. By significantly reducing the administrative processes required of the teams, attention can be focused on the coordination and staffing processes which are most representative of the real-world situations the players will encounter.

The primary purpose of TEMPO is to train military leaders in the skills of force planning and resource management under the realistic constraints of time, uncertainty, and a limited budget. These skills are as important in today's international military environment as are those of force employment in theater or strategic conflict.

The manipulation of strategic forces in this game has been greatly simplified to focus the attentions of the players on the force planning and resource allocation aspects of the situation. These aspects include the selection of alternative weapon systems, the maintenance of proper force mixes, the total life cycle costs of the systems, cost effectiveness considerations, long-range planning, and the elements of risk and uncertainty.

The game uses actual weapon systems as the objects of this planning. No attempt has been made to exhaustively analyze the effective utility of a specific red force system against its corresponding blue force system. Opposing

systems were consents to be 'roughly' equivalent in utility, and the names are included solely to stimulate player interest in the game.

There are few features of this version of TEMPO which are unique. It is based primarily on the game as played at Air University in Montgomery, Alabama. Its uniqueness lies in its implementation on the PDP 11/72 computer resident in the C3 Laboratory at the Naval Postgraduate School. This provides players with the capability to interact in realtime with the program through the war-gamine stations in the laboratory.

Appendix A to this thesis is designed to serve as a stand-alone User's Manual for students who will be playing TEMPO in the future. It provides all the necessary background and guidance to accomplish the objectives of the game.

#### II. GENERAL DESCRIPTION

TEMPO is played with an umpire and two teams, a red force and a blue force. Both teams start with identical force structures, research and development options, and budgets. That is to say, the costs, utilities, and research and development potentials for corresponding systems on each side are the same even though the systems have different names.

The budget, which varies from year to year, may be spent in any of six ways: (1) operation of forces, (2) acquisition of additional forces, (3) research and development of new systems, (4) modifications to existing weapon systems, (5) intelligence or counterintelligence, and (6) trade-off analyses between systems.

The game spans eight years with the first four years being operational years and the last four years being programmed years. All transactions must be completed within the allotted time, or budget penalties for the ensuing year will be incurred.

The categories of systems which each team has to work with are limited to offensive strategic aircraft, offensive strategic missiles, surface-to-air missiles (aircraft defense), and defensive anti-ballistic missile (ABM)

missiles. Several types of weapon systems are available in each category through the course of the game. System capability is quantified in terms of a standard measure of effectiveness called the "util". Each weapon system is worth a specific number of utils while it is in the active force. The author recognizes that one of the key factors in determining proper force structure is the effectiveness of one's own forces versus the opposition they are most likely to encounter. However, for the purposes of this exercise, utility will be treated as a giver, thus allowing concentration on the budgetary aspects of the situation.

The objective of the game is for each team to operate its offensive forces to maximize its net offensive utils while operating a defensive force to minimize the opponent's net offensive utils. The limited budget which each team must work with increases the challenge of this objective. The teams must decide if it is worthwhile to allocate scarce budget dollars to research and development for improvement of the force efficiency. Dollars spent for programs other than strictly procurement of existing systems may result in less than optimum current force structures in order to In addition, teams must decide improve future balance. whether or not to invest in intelligence about their opponent. An analysis option for making cost-benefit tradecffs is also available to each team.

There are three versions of TEMPO available in the C3 laboratory. The normal version requires four hours to complete the game. This mode allows for extensive planning periods which are desirable for larger teams to derive the full benefit of cooperative staffing in the various areas of concern. The short version requires two hours for completion and has much shorter planning periods. This mode allows the teams to get an exposure to the features of the game under an extreme time constraint. The third version is a demonstration program to allow a single user to examine the features of the game. There are no time constraints involved in the demonstration program.

# III. PLAY OF THE GAME

This chapter describes how to initiate the TFMPC game and cutlines the options available to the players as the game progresses.

#### A. OBJECTIVE

The objective of the game is for each team to operate its offensive forces to maximize its net offensive utils while operating a defensive force to minimize the opponent's net offensive utils. The formula for determining a team's net offensive utils is:

(total offensive aircraft utils minus opponent's total anti-aircraft utils)

plus

(total offensive missile utils minus opponent's total anti-missile utils)

The net offensive utility resulting from this calculation is compared to the opponent's net offensive utility to determine who wins each year. The teams will be notified at the end of each year whether they won or lost that particular year. The overall winner of the game is the team which has the greater cumulative total of net offensive utils for the eight-year period.

The players should bear in mind that utils are only received for systems which are in the active force. No credit is received for over-defending. That is, it does no good to have more defensive utils in a particular weapon system category than the opponent has offensive utils. And finally, anti-aircraft systems are only effective against aircraft, and anti-ballistic missiles are only effective against offensive missiles.

#### B. STARTING THE GAME

To begin the game, the teams should login to the computer at their respective stations. The computer directories are 'tempored' and 'tempoblu' with passwords 'tempor' and 'tempob' respectively. The demonstration version of TEMPO is accessed by logging into 'tempdemo' with password 'tempod'.

The first option the teams are offered is whether they want to play the long or short version of the game. TEMPO will not operate properly unless both teams select the same version.

The next few displays the teams receive will be introductory remarks and initial force status. This information is available at any time during the game and, thus need not be recorded.

When the teams have had sufficient time to review the initial data the umpire will signal the beginning of the

game. To initiate play the teams press the carriage return keys at their respective stations and the game commences. TEMPO has a strict timing protocol which it controls automatically from this point on; however, it is important that both teams begin at the same time to ensure that the programs are coordinated. If there is a significant difference in the times that the respective teams initiate play, it is recommended that the game te restarted.

#### C. ANNUAL PLANNING

The next display to appear on the screens is a menu of options available for the teams to choose from. An example of the menu is shown in figure 1. Note that the time remaining for the year's planning is shown at the top of the display. This countdown will appear on every display until the final plan is submitted for the year. The menu items shown may be reselected as often as desired during each year. These items will be described in detail in the following paragraphs.

## 1. Current Force Status and Data

This segment of the program provides a summary of all systems in the current operating inventory. An example is shown in figure 2. The display includes number of systems in operation, acquisition cost, operating cost and utility of each system. The number of systems of each type which can be purchased in any one year is also listed.

TYPE CARRIAGE RETURN TO RETURN TO MAIN MENU

Figure 2. Current Force Status Disilay

Finally, the total cost of operations and the total utility for the entire force of each weapon system type is listed. The teams would probably want to review this table at the beginning of each year to ensure that the previous year's buys and scraps were reflected.

### 2. Research and Development Data

The first display which appears when this option is selected shows which research and development (R&D) programs are available for that particular year. An example is shown in figure 3. The teams have only one year to begin work on a particular program. If they do not select the option they will not have the opportunity the next year. There is one exception to this rule. The R&D required prior to a system modification can be done in any of the first three years.

New research programs are offered only in years one, two, and three of the game. Programs begun in these years may be continued to completion but no new programs will be started beyond year three.

The teams will be asked if they wish to see a complete R&D report for the year. This report is shown in figure 4. It provides estimates of acquisition cost, operation cost, utility and R&D costs for each available program. The teams will be told how long the development will take and what the expected R&D costs for the future years of the program will be. The current year R&D cost is actual. However, the subsequent years' costs, as well as the final utility and

Figure 4. Complete R&D Report Distlay

operation nost are only estimates and may increase or decrease lepending on now the program progresses.

Finally, in this module, the teams are asked if they wish to spend funds for any of the programs. Note that the full RNP report described above need not be reviewed in order to invest RNP funds. If the team wants to invest funds in RNP a third display appears with a menu of randidate programs. An example of this display is shown in figure 5. The actual and projected PNP costs are again shown along with a status report of engoing programs. If the team has begun a project in a previous year it is reminded to continue the funding or else jeapordize the delivery schedule. The teams do have the option to cease funding of a program after the first year of RNP has been completed and then resume the development in a later year.

Additional RSD information on a system will be available only if the team initially chooses to pursue the program.

# 3. Current Eudget Data

This module provides each team with the total budget figure for the year, the total cost of operating the force for the year, and a running total of dollars spent up to that point in the year. An example is shown in figure 6. Eudget estimates for the next two years are also provided. Actual allocations for future years may vary but the estimates can provide a basis for planning. The

probabilities of war, as currently estimated, are provided in this module.

One subtlety should be noted here. In order to determine funds available for use for the remainder of the year, total dollars spent must be added to operation costs and the sum subtracted from the total budget for the year.

#### 4. Buy Additional Systems

Selection of this option provides each team with a list of all systems which are available for purchase. See figure ? for an example. Included in the list are the acquisition costs, utility, and purchase limits for each system. The players simply choose which system they want and the computer will ask how many the team wants to buy. When that input 15 provided the players receive acknowledgement of the sale. They are told how much was spent and how much of their budget for the year remains. If the team tries to buy more than the purchase limit the computer will provide only the maximum available.

Systems bought in one year will not be operated until the following year. Consequently, no operation costs will be incurred and no utility will be gained until the next year.

A new system is available for purchase as soon as all the R&D has been selected and paid for. A team may acquire units of a new system during the last year of R&D (provided the R&D has been funded), or at any time thereafter. A team

cannot lose its option to buy units of a system once it is in the inventory.

# 5. Modify Systems in Current Inventory

At certain points in the game the teams will be offered the opportunity to modify or upgrade weapon systems they have in their inventories. These modifications are not possible without developing the technology which goes into them. Therefore, the R&D for the modification must be funded before the modification can take place. This funding is provided through the R&D module described above.

When the modify option is selected the players will be offered candidate systems for upgrade. An example of this display is shown in figure 8. There are two ways a system can be modified. It can be withdrawn from operations for the year, thus incurring no operation costs and providing no utility. Or it can be operated at the unmodified levels until the next year when the modification is complete and it automatically assumes the upgraded levels. The teams must choose how many units they want to modify and how they want to distribute the way they are modified. The computer will provide the necessary advisories.

To purchase upgraded systems directly, (that is, other than upgrading systems already in the inventory) it is still necessary to pay the modification R&D cost (if it has not been paid). The new units can be purchased at a price equal to the procurement cost of the unmodified system plus the

THE ONLY SYSTEM WHICH YOU CAN MOD AT THIS POINT IS THE B-52G.

NOTE: YOU MUST FUND THE RED BEFORE YOU CAN MODIFY.

YOU NOW HAVE \$6400 LEFT THIS YEAR. (This includes your OaM money) YOU MAY CHOOSE HOW MANY OF THE UNITS BEING MODIFIED YOU WANT LEFT IN OPERATION WITH THE UNMODIFIED UTILITY RATE AND OPERATION COST. HOW MANY DO YOU WANT?

Figure 8. Modify Systems Display

modification cost. This option will automatically be made available to the teams through the BUY module when the modification R&D is completed.

Modifications may be made at any rate not exceeding the purchase limit of the original system. R&D for the modifications may be performed at any time during the first three years of the game.

# 6. Scrap Systems in Current Inventory

It may be necessary at certain junctures of the game to get rid of older, less-efficient systems in order to free up their operations costs for other purposes. This can be done by selecting the SCRAP menu choice. A complete list of systems in the current inventory is displayed and the team is asked which system it would like to scrap (see figure 9). It is then asked how many units it would like to take out of operation. The computer acknowledges the entry. Force units scrapped in one year will remain in the inventory until the following year.

#### 7. Buy Intelligence Data or Counterintelligence

Selection of this module provides the team with a menu of ten options for intelligence gathering (see figure 10). For \$100 each the team can get a complete report of the opponent's:

- a) current force structure of offensive forces, or
- b) current force structure of defensive forces, or

Figure 10. Buy Intelligence Display

- c) current R&D programs for offensive systems, or
- d) current R&D programs for defensive systems.

  Intelligence reports on force structure do not provide an exact count of enemy systems. Rather, they present a tenunit range for each system, e.g. "SYSTEM-A has 20-29 units" is the report if the opponent has 22 units.

RSD intelligence reports list all programs for which R&D funds were expended that year by the opponent. This will not indicate if he has started a program in an earlier year and not funded it during the current year.

Either team may purchase counterintelligence in any of the four areas described above for \$50 per category. Counterintelligence reports inform the team if the enemy has purchased intelligence in that category during the year.

The intelligence menu provides the option to cancel all orders for intelligence and start over again for the year.

If an intelligence report is requested it will be presented automatically at the beginning of the following year's planning period.

Intelligence reports cannot be obtained in years five through eight.

# 8. Perform Trade-Off Analyses

This module may be selected any time during years one through four to assist in making decisions as to which systems to buy. The analysis branch provides a complete list of systems which are, or could be, available at that

time for procurement or R&D. The menu is shown in figure 11. The team is asked to select two systems to be compared and an immediate analysis is presented as shown in figure 12. The report includes year-by-year life-cycle-cost breakouts for both selected systems and yearly utility figures. Totals for both of these parameters are tabulated and used to compute a util/dollar cost effectiveness factor. This value is simply the total life cycle utility divided by the total life-cycle cost.

The teams will not be prevented from performing tradeoffs using systems they may have chosen not to R&D. This kind of analysis is not very useful, however, since the preferred option may not be possible to obtain.

The cost of analysis is \$25 for each trade-off performed.

# S. Recovery From Entry Errors

This module is merely a tutorial to explain how to change entries the teams may have made and then later reconsidered. It is not possible to recover from every entry error, particularly in the R&D module. A team cannot "un-start" development of a new technological program until the next year. For this reason it is strongly recommended that the teams carefully plan their expenditures and programs for the year before they enter the data. Figure 13 shows the text of the tutorial.

WELCOME TO THE ANALYSIS BRANCH.

THIS SUBPROGRAM ENABLES YOU TO COMPARE TWO SYSTEMS TO DETERMINE WHICH IS THE MOST COST EFFECTIVE PURCHASE.

THE B-62G IS CURRENTLY OPERATIONAL. SINCE THE FOCUS OF THE GAME IS HOW TO BEST UTILIZE THE AVAILABLE BUDGET RESOURCES FOR THE REMAINDER OF THE GAME, SUNK COSTS (e.g. PAST R&D) ARE NOT FACTORED INTO THE LCC COMPARISON. THREE BUYS OF 20 UNITS WILL BE MADE, ONE IN EACH OF THE NEXT THREE YEARS. THE SYSTEMS PURCHASED WILL BE OPERATED FOR THE REMAINDER OF THE TEN YEAR GAME.

COSTS OF DEVELOPMENT WILL BE CONSIDERED SINCE OUR CONCERN HERE IS FOR THE VALUE RECEIVED FROM CURRENT AND FUTURE AVAILABLE FUNDS. THE SYSTEMS PURCHASED WILL BE OPERATED FOR THE REMAINDER OF THE TEN YEAR GAME. THE B-52G MOD IS STILL IN THE RGD PHASE. THE COSTS USED FOR THIS ANALYSIS WILL BE THE LATEST ESTIMATES. INCLUDED IN THE ANALYSIS ARE THREE BUYS OF 20 UNITS, ONE IN EACH OF THE FIRST THREE YEARS THE SYSTEM IS AVAILABLE. IF YOU HAVE ALREADY BEGUN RGD, ONLY THE REMAINING

YEAR

when the team has completed all of its actions and requests for the year, the final selection on the menu is entered. It should be noted that each team is given a specific time to use for current and long-range planning. It is strongly recommended that the teams take full advantage of their allotted time to carefully prepare their plans. There is no advantage to an early submission of the yearly plan. The computer will simply make the team wait for the end of the period anyway. It should also be emphasized that a team is penalized for a late submission. Significant dollar reductions from the next year's budget are assessed for each minute the plan is delinquent.

Upon selection of the year-end option from the meru, the tears are asked to confirm that they, indeed, are done for the year. At this point they have the option of returning to the main menu for subsequent adjustments.

When a confirmed entry is made, the year-end module performs several processes in closing out accounting for the year. Figure 14 shows the first report which provides a summary of utils provided by the weapon systems and dollars spent for the year. This report is immediately displayed at the team's terminal.

Next, the teams are advised of a break period to allow them to relax and collect themselves for the next planning cycle. During the break, the umpire program is called up

# 12. Submit Completed Planning and Budseting

SUMMARY OF YEAR 1 BRIEF HERE IS A YOUR TOTAL OFFENSIVE A UTILS WERE 750. YOUR TOTAL DEFENSIVE A UTILS WERE 1000. YOUR TOTAL DEFENSIVE A UTILS WERE 1000.

:688 THE TOTAL OPERATIONS COSTS FOR YOUR SYSTEMS WERE

YOUR TOTAL EXPENDITURES FOR THIS YEAR WERE CERO.

THIS IS THE END OF YEAR 1. FOLLOWING A FIRTEEN MINUTE BHEAK, YOU WILL BE GIVEN 45 MINUTES TO PREPARE YOUR PLAN FOR YEAR 2. IF YOU REQUESTED INTELLIGENCE DATA YOU WILL RECEIVE IT AT THE BEGINNING OF NEXT YEAR'S PLAY.

THIS YEAR WAS A DRAW

Figure 14. Year End Display

and the data are fed to a central point for recording and determination of the winner for the year. The umpire program uses a random number routine to determine whether a war has occurred during the year. If a war has broken out, messages to that effect are written into files and later retrieved by both sides. The activities of the umpire program are all transparent to the players of the game. Finally, the year-end routine updates the database for the coming year, and passes intelligence data tack and forth between the red and blue sides.

when the program becomes active again, an introductory report for the next year will appear on the terminal screen (see figure 15). At this time, the intelligence reports which were requested during the previous year are also available simply by pressing the carriage return key on the terminal keyboard. A sample intelligence report is shown in figure 16. Following review of the intelligence reports, the teams receive the original menu and repeat the process for the next year.

#### D. WAR

Throughout the game there is a threat that war could break out in any year. The intelligence sources for each side will keep the teams informed of the best estimate of probability of an cutbreak of nostilities for each year. This information is provided at the beginning of each year.

THIS IS YEAR 2 OF THE GAME.

YOUR BUDGET FOR THIS YEAR IS \$8000. BUDGET ESTIMATE FOR NEXT YEAR IS \$9500. BUDGET ESTIMATE FOR THE FOLLOWING YEAR IS \$9500.

THE PROBABILITY OF WAR FOR THIS YEAR IS 0.15 INTELLIGENCE ESTIMATES THE PROBABILITY OF WAR FOR NEXT YEAR TO BE 0.25

IF YOU ORDERED INTELLIGENCE REPORTS, THEY WILL APPEAR NEXT ON THE SCREEN.

FOR MORE DETAIL ON THIS YEAR'S FORCE STATUS AND PROGRAMS SELECT THE DESIRED ENTRY FROM THE FOLLGLING MENU.

PRESS RETURN TO CONTINUE.

B-52G MOD FB-111H NOTE: YOU WILL NOT SEE THESE REPORTS AGAIN SO YOU WOULD BE WELL ADVISED TO RECORD THE DATA YOU NEED.

Figure 16. Sample Intelligence Report Display

and need not be requested or funded. It is also available in the EUDGET module at any time during the year. Wars will not last more than one year at a time.

If a war occurs, the cost in resources for each team will be reported to them and a winner will be declared. The format for this report is shown in figure 17. The overall winner of the game, however, will be the team with the most net offensive utils for the entire eight-year game period.

#### E. PENALTIES

If a war occurs both teams will have \$400 cut from the budget for next year. In addition, the loser's budget will be cut by an amount equal to twice the difference between the two teams net offensive util count calculated for the year the war occurred.

If a team allocates more funds than it has in its budget during a given year, the budget in the following year will be reduced by twice the amount of the deficit. In addition, as soon as a team's expenditures (allocations plus operating costs) exceed the budget, the program will take it automatically to the year-end module. The team has the option of returning to the main menu. However, with each additional expenditure it will once again be sent to the year-end module. Advisories will be provided to explain what is happening but the awkwardness of this condition will presumably prevent significant overexpenditures.

HAS BROKEN OUT THIS YEARII

<CR> to continue

Figure 17. Sample War Report Display

If a budget is submitted late (that is, if the end-of-year menu selection is not made in the allotted time) the budget for the next year will be reduced by \$50 per minute for the first five minutes, and \$120 per minute for each minute over five minutes.

If a team does not spend its entire budget for the current year, the remainder of the funds are lost. There is no carryover to the following year.

### F. WEAPON SYSTEM EFFECTIVENESS

The total utility of a given weapon system for one year is not simply the number of utils times the number of systems. The Law of Diminishing Marginal Returns postulates that stockpiling one particular weapon system which has a high utility does not insure success, nor does it support a balanced force concept. Therefore, the final util count for a system in a particular year may be reduced by some amount. The scheme for this util discount is shown in figure 18. For example if a team has 100 weapon systems, each with a utility of 55, the team will receive a total utility for that system of 4400 + 320 = 4700 rather than 5500.

#### G. DOCUMENTATION

Teams will be provided with blank budget allocation forms to assist them in planning where resources will be spent for the year. These forms need not be submitted at any time. They are merely tools to make the organization of

# FORCE UNIT UTIL DISCOUNT

Total utils of any individual force unit are discounted as follows:

TOTAL ORIGINAL UTILS 1 - 2000	FINAL NET UTIL Voriginal total	ALUES
2001 - 3000	2000 plus 90% of	arount over 2002
3001 - 4000	2900 plus 80% of	amount over 3000
4001 - 5000	3700 plus 70% of	amount over 4000
5001 - 6000	1400 plus 60% of	amount over 5020
6001 - 7000	5000 plus 50% of	amount over 6000
7001 - 8000	5502 plus 40% of	amount over 7020
8001 - 9000	5900 plus 30% of	arount over 8000
9001 - 12000	5200 plus <b>20%</b> of	amount over 9000
10021 - 11000	5400 plus 10% of	amount over 1000
over 11200	3520 maximum net	utils

Figure 18. Utility Discount Scheme

the teams easier. A sample budget allocation form is shown in figure 19.

Each year both teams receive an actual budget for the current year plus estimated budgets for the next two years. These estimated budgets may change, but they can assist in making some long-range plans. The Multiple Year Defense Program(MYDP) is patterned after the Five Year Defense Program and is provided to help the teams formulate long-term force plans. The MYDP is merely a worksheet and will not be submitted. A sample MYDP is shown in figure 20.

#### E. UMPIRE

The umpire has only one responsibility in the play of this version of TEMPO. He must signal the start of play when both teams have had the chance to review initial game data.

The umpire can also observe game status in terms of each team's utility totals for each year by logging into 'umpire' with password 'umpire' and examining the file "ump" (type 'aa ump" once in the directory). This is a cumulative file which is updated at the end of each year. Note that the file must be recalled at the end of each year to receive the most current data. A file teing displayed will not be automatically updated as it is being viewed.

# IV. PHILCSOPHY OF THE GAME

## A. TEAM ORGANIZATION

There are no limits on the number of players who may play this version of TEMPO. One player can familiarize himself with the program through the demonstration version. Two players can learn from the exercise in either the short or long version. However, the real value of the game is gained when it is played by two teams each with several players. With a staff organization on both sides, the players can begin to appreciate the challenges of orchestrating an annual budget. The operational commanders must cooperate with the budgeteers and the schedule monitors must ensure that everyone understands the criticality of time.

There is no optimal organizational structure for all teams. It is recommended that one of the players on each team assume the role of team leader, or commander.

Some steps which might be helpful in establishing a team framework are analyzing the problem, setting an overall goal, developing a plan, and organizing.

### 1. Analyzing

Before the teams enter the lab they should carefully review the User's Manual as presented in Appendix A. This gives enough background to provide them a good idea of what

it is they are trying to accomplish. It describes the constraints they must work under and the opportunities they will have. A group discussion of the various interpretations of this manual should give the group a good fundamental idea of the problem.

# 2. Gcal Setting

It may be nelpful for the teams to establish a tangible quantitative goal at the cutset of the game. "To win the game" is an admirable goal but without a more definitive measure (or guess) of what it will take to do so the team has achieved no benefit. There is no harm in adjusting goals as the game progresses but the teams should try to establish some desired level of preparedness for a point in the future. Failure to do so can sometimes result in aimless wandering in search of an appropriate force.

### 3. Planning

Once goals are set the team should begin to plan how they will attempt to achieve these goals. If the approach chosen is to make maximum use of intelligence sources to plan R&D programs, the team should fortify its planning for such. If the team chooses to amass forces already available it should establish a plan for doing so. These plans are relatively easy to initiate simply by concentrating the staff resources at the point where the strongest thrust is desired. The teams should try to anticipate potential problem areas and have contingencies to back them up. It

may also be helpful at this stage to establish procedures for a consistent approach to planning and analyzing throughout the game. Analyses must be reproducible and R&D procedures should be consistent throughout.

## 4. Organizing

The Squadron Officer's School curriculum proposes a five-step process of organizing a TEMPO team once the initial planning is complete. First, all objectives should te listed based on goals and plans. Second, the objectives should be grouped into functional areas. Third, a ranking of these objectives is established based on the relative importance of the functions. Next, a functional organization chart may be sketched to see how the pieces interact. And finally, available staff members should be assigned to the functional areas. Questions may arise regarding decision-making procedures. span control, specialists in certain areas, and functional group interfaces. When the questions have all been answered, the team is ready to begin the game.

#### 2. TIME LAG

Most observers of the Department of Defense system acquisition process agree that ten years is a good estimate of the time it takes a weapon system to develop from an idea to a combat system in the field. This time lag is one of the parallels of reality included in TEMPO. Although the

development time will more likely be two or three years rather than ten, the teams nust use some foresight to anticipate the benefits to be gained by developing new systems. Figure 21 shows a utility comparison, similar to those available in the ANALYZE module of the game, which illustrates trade-offs which must be made.

SYSTEM A 50 util/unit Operational

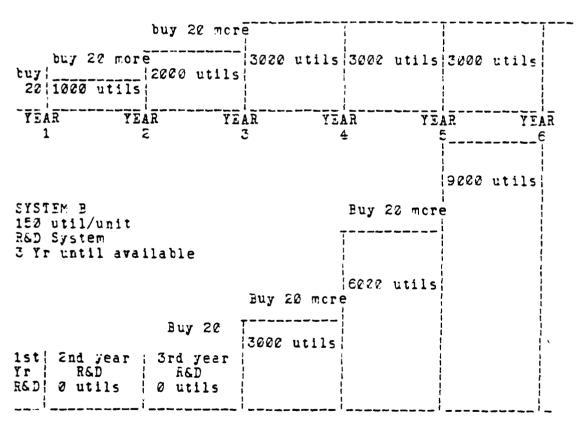

Figure 21. Utility Comparison

The teams must evaluate the probabilities of war in the early years as compared to the benefits to be gained in the long run before making the decision to buy or RSD. However, they should not lose sight of the fact that net offensive utility over the eight year period of the game determines the winning team.

#### C. ANALYZING THE OPPONENT

TEMPO uses a very simple algorithm in its analysis module for determining life-cycle utility per dollar of a candidate system. The teams should observe that this same formula can be used to analyze and bound the opponent's capabilities using data obtained from intelligence reports. Specifically, if a team learns that its opponents have 12-19 units of a system with 25 utils per unit and a \$40 operating cost per unit, it can deduce that it must have between 250 and 475 defensive utils to offset the opponent's force. It also knows that the opponent must use \$400-760 of his budget to operate that force. By anticipating what new systems will be coming into the inventory from R&D programs and making insightful guesses as to how many the opponent is likely to buy based on his budget constraints, an effective counterforce can be planned and fielded.

### D. HINTS

There are a few insights which could prove helpful during the play of TEMPO. Teams will undoubtedly discover many more as they gain experience with the game.

- 1. The most useful piece of advice is to carefully read the User's Manual before beginning to play the game. The constraints imposed by TEMPO do not allow time for familiarization during the planning periods.
- 2. The teams may went to investigate linking a hardcopy miniterm to the war gaming terminal during play so that a permanent backup copy of reports is available for staff planning.
- 3. If a team overspends its budget during a given year there is only one way to reduce current year expenditures. In the MODIFY module the team is asked if it wants to take current systems off the line while they are being modified. If the team so chooses, the operating costs for the current year are eliminated. In this way a limited amount of operating costs for the year can be reduced. This is a subtlety which the instructor may wish to let the teams discover for themselves.
- 4. Instructors should also beware of students who have prior experience with the game. These students can be helpful in explaining details to their teammates.

However, if one team has prior experience while the other does not, an undesirable imbalance could result.

# V. STRUCTURE OF THE GAME

#### A. PROGRAM ARCHITECTURE

The computer program which implements TEMPO in the C3 Laboratory was written in C Language on the UNIX Operating System. The computer is a PDP Model 11/72. Ann Arbor terminals were used for development and are recommended for play of the game. A minimum of three terminals are required for the game. With minor modifications for screen size, the program is transportable to any other comparable system.

TEMPO is composed of three primary elements. These are the Red Force program, the Blue Force program, and the Umpire program. The top level computer program architecture is depicted in figure 22. Note that the BLUSIDE program actually calls the UMPIRE program while the REDSIDE program merely provides data to the UMPIRE.

Figure 22. Top Level Architecture

The two primary programs, REDSIDE and BLUSIDE, are accessed by logging into the respective war-gaming stations with login names 'tempored' and 'tempoblu' respectively. Passwords are 'tempor' and 'tempob'. Once logged in, the

players initiate the program by typing 'begin'. The umpire reports are accessed by logging into the directory 'umpire' with password 'umpire'. There is no user interaction with the umpire program other than to read its resident files. The umpire program is called and executed by BLUSIDE at the end of each game year. REDSIDE furnishes its data to UMPIRE by writing it into a file which UMPIRE later reads. A more detailed computer flowchart is provided in figure 23.

The first nine subroutines below each major program in figure 23 are the menu selections each side is afforded during the yearly planning cycles. These were described functionally in Chapter 3. The code and program descriptions are provided in the Computer Program section at the end of this thesis. Detailed descriptions of the subunits of the DONE subroutine are also contained in the Computer Program section. An important point for discussion here, however, is the way in which data is passed among the three main programs in the game.

One of the options available to the players is the purchase of intelligence or counterintelligence data regarding the opponent's status. In order to do this each side writes its force structure and R&D activity for the year into files (BLUOFF, BLUDEF, BLURDO, BLURDD, CNTRINT, etc.). as shown in figure 23. These files are made available to the other side through selection in the INTREP subroutine. The reason for five separate files for each

```

Figure 23. Detailed Program Functional Diagram

side is that the teams are charged budget dollars for access to each type of information. If all information were put in the same file the denial of nonrequested information would be considerably more difficult.

Another aspect of the game which bears mention here the possibility that a war will occur during any year. probability of war is an input value. Bowever. occurrence of a war is determined by a random number generated in the UMPIRF program. If the random number falls in the designated probability window, war is declared and a flag is set in the umpire file WAR. The UMPIRE program automatically selects and sends the appropriate win or loss messages and budget reductions to the two teams. Both team programs read the WAR flag at year's end. If a war has occurred they read the results in the files FLUWAR1, BLUFDBK, and REDWAR1, REDFDBK respectively. BIUWAR1 and REDWAR1 describe the outcome of the war and BLUFDBK and REDFIBE provide the necessary budget penalties to be deducted from each side.

The datafile UMP generated by UMPIRE is a cumulative accounting of offensive and defensive status for each team by year for the entire game. This is available for review by the umpire by logging into 'umpire' and reading the file through the editor (type "ea ump").

The DATABASE subroutine is read at the beginning of each year to update weapon system costs and characteristics as they change throughout the game.

### B. LESSONS LEARNED

There were some significant problems encountered during the coding of TEMPO and some lessons learned which may help future C Language programmers on the UNIX system. The most pressing problem for a considerable part of this effort was a perceived program size constraint. Much of the structure of the present programs was dictated by an apparent lack of program space. The perilous error message output by the system when this problem is encountered reads "ld: Ead format". Late in the programming phase it was discovered that by using the compiler option "-i", this problem can be virtually eliminated. To use this option the programmer simply must partition his program into two or more smaller segments, and then, when compiling, type "cc -i segment1.c segment2.c etc.c" instead of the usual "cc entire.c".

Another difficult problem was timing the data transfers between subprograms and subroutines of the opponents and of the umpire. This was solved by writing the current data into files early in the year-end process and reading from the appropriate files later. To ensure that both programs tegin at the same time, the EARLY subroutine was inserted. This stops the processing of the teams in the event that

they finish their entries before the allotted time is used up. It also keeps the entire game on a strict time schedule so that small offsets early in the game do not grow into large offsets over the eight year game period. The possibility that a team uses more than its allotted time was addressed by a statement in the umpire program which inhibits further processing until the year tag on each team's data is equivalent. The subroutine TIMECHK also checks to see if a team was delinquent in its year-end submittal. Furthermore, since the last four years of the game are program years and all data for the four years is submitted in one planning period, these data are sent to separate files for each year to ensure that the proper comparisons are made.

Most of the other problems encountered were solvable through a mixture of perseverence and a return to good structured programming practices.

## VI. RECOMMENDATIONS

Although the TEMPO game is fully functional at this time, there are several improvements which could be incorporated to 'dress it up'. One goal which was not fulfilled was the incorporation of computer graphics into the program. With the extensive color graphics capabilities in the C3 Laboratory, the potential for graphical representation of many of the team reports is very exciting. Force levels, intelligence reports, and war declarations are only a few of the possible areas for graphical presentations.

An area which has a great potential for improving the reality of the game is the determination of weapon system utility. Currently, this is a database input selected arbitrarily by the game designer. In the present implementation, the total utility of a force of particular weapon systems is a function only of the number of systems and the defense of the opponent. In reality, utility of a weapon system is also a function of the number of corresponding offensive systems the opponent has in his inventory. An example of this is the seeming decline in utility of U.S. ICBM forces due to increasing numbers of Soviet ICBM forces. Utility is also a function of the number of delivery systems available for the weapon system

under consideration. Or, if the weapon system under consideration is a delivery system, its utility is a function of the number of weapons available. In addition, utility could be considered a function of the number of other types of systems the team has in inventory. For example, a force composed entirely of tombers probably does not provide as much utility as a balanced force of missiles and bembers. The development of a utility module that would consider all of these factors in determining utilities would be a challenging exercise which would lend greater realism to the TEMPO game.

Another area which could be improved upon is the determination of the probability of war. Fresently, this is also a database input chosen to give the teams a year or two to get a feel for the game, and then be fairly well assured that a war will occur at least once during the game. To be more realistic a set of thresholds for increasing war probabilities could be developed. For example, if a team has an extremely low level of defensive forces and the other team finds out through an intelligence report, it would be reasonable to expect that the probability of war would increase. If a team determines that it could bankrupt its opponent through an overwhelming battle victory, the likelihood of an attack should increase. If a team displayed an immense offensive buildup in one year or in successive years, that could signal an increase in the

likelihood of war. These thresholds would be relatively easy to determine and fairly straightforward to implement in the code.

### APPENDIX A

# TEMPO USER'S MANUAL

#### I. INTRODUCTION

The TEMPO Military Planning Game was criginally developed in the early 1960's by the Technical Military Planning Organization (TEMPO) of General Electric Company in Santa Barbara, California. Since that time it has been used by the Defense Resources Management Course at the Naval Postgrafuate School; the U.S.Army Management School, Et.Belvoir, Virginia; the Air War College, Air Command and Staff College, and Squadron Officers' School all at Maxwell AFB, Alabama. Additionally, many variations of the game nave been developed and used throughout industry and the government.

Play of the game may be approached from several different perspectives ranging from simple diversion to studies of interpersonal behavior. Its primary purpose, however, is to train military leaders in the skills of force planning and resource management under the realistic constraints of time, uncertainty, and a limited budget. These skills are particularly important to officers entering the world of Command, Control, and Communications(C3) since the timely fielding of C3 systems is crucial to the strategic and tactical security of our military forces.

The manipulation of the strategic forces in this game has been greatly simplified to focus the attentions of the players on the force planning and rescurce allocation aspects of the situation. These aspects include the selection of alternative weapon systems, the maintenance of proper force mixes, the total life cycle costs of the systems, cost effectiveness considerations, long range planning, and the elements of risk and uncertainty.

The game uses actual weapon systems as the objects of this planning. No attempt has been made to exhaustively analyze the effective utility of a specific red force system against its corresponding blue force system. Opposing systems were chosen to be "roughly" equivalent in utility, and the names are included solely to stimulate player interest in the game.

There are few features of this version of TEMPO which are unique. It is based primarily on the game as played at Air University in Montgomery, Alabama. Its uniqueness lies in its implementation on the PDP 11/70 computer resident in the C3 Laboratory at the Naval Postgraduate School. This provides the players with the capability to interact in real-time with the program through the war-gaming stations in the laboratory.

### II. GENERAL INSTRUCTIONS

TEMPO is played with two teams, a red force and a clue force, and an umpire. Both teams start with identical force structures, research and development options, and budgets. That is to say, the costs, utilities, and research and development potentials for corresponding systems on each side are the same even though the systems have different names.

The budget, which varies from year to year, may be spent in any of six ways: (1) operation of forces, (2) acquisition of additional forces, (3) research and development of new systems. (4) modifications to existing weapon systems, (5) intelligence or counterintelligence, and (6) trade-off analyses between systems.

The game spans eight years with the first four years being operational years and the last four years being programmed years. All transactions must be completed within the allotted time, or tudget penalties for the ensuing year will be incurred.

The categories of systems which each team has to work with are limited to offensive strategic aircraft, offensive strategic missiles, surface-to-air missiles (aircraft defense), and defensive anti-ballistic missile (ABM) missiles. Several types of weapon systems are available in each category through the course of the game. System capability is quantified in terms of a standard measure of

effectiveness called the "util". Each weapon system is worth a specific number of utils while it is in the active force. The author recognizes that one of the key factors in determining proper force structure is the effectiveness of one's own forces versus the opposition they are most likely to encounter. However, for the purposes of this exercise, utility will be treated as a given, thus allowing concentration on the tudgetary aspects of the situation.

The objective of the game is for each team to operate its offensive forces to maximize its net offensive utils while operating a defensive force to minimize the opponent's net offensive utils. The limited budget which each team must work with increases the challenge of this objective. The teams must decide if it is worthwhile to allocate scarce budget dollars to research and development for improvement of the force efficiency. Pollars spent for programs other than strictly procurement of existing systems may result in less than optimum current force structures in order to improve future balance. In addition, teams must decide whether or not to invest in intelligence about their opponent. An analysis option for making cost-benefit tradeoffs is also available to each team.

There are three versions of TEMPC available in the C3 laboratory. The normal version requires four nours to complete the game. This mode allows for extensive planning periods which are desirable for larger teams to derive the

full benefit of cooperative staffing in the various areas of concern. The short version requires two nours for completion and has much shorter planning periods. This mode allows the teams to get an exposure to the features of the same under an extreme time constraint. The third version is a demonstration program to allow a single user to examine the features of the same. There are no time constraints involved in the demonstration program.

# III. DETAILED RULES

## 1. OBJECTIVE

The objective of the game is for each team to operate its offensive forces to maximize its net offensive utils while operating a defensive force to minimize the opponent's net offensive utils. The formula for determining a team's net offensive utils is:

(total offensive aircraft utils minus opponent's total anti-aircraft utils)

plus

(total offensive missile utils rinus opponent's total anti-missile utils,

The net offensive utility resulting from this calculation is compared to the opponent's net offensive utility to determine who wins each year. The teams will be notified at

the end of each year whether they won or lost that particular year. The overall winner of the game is the team which has the greater cumulative total of net offensive utils for the eight-year period.

The players should bear in mind that utils are only received for systems which are in the active force. We credit is received for over-defending. That is, it does no good to have more defensive utils in a particular weapon system category than the opponent has offensive utils. And finally, anti-aircraft systems are only effective against aircraft, and anti-ballistic missiles are only effective against offensive missiles.

## 2. STARTING THE GAME

To begin the game, the tears should login to the computer at their respective stations, i.e. the Kremlin at one end of the laboratory and the Pentagon at the other end. The computer directories are 'tempored' and 'tempoblu' with passwords 'tempor' and 'tempob' respectively. The demonstration version of TEMPO is accessed by logging into 'templemo' with password 'tempod'. Upon login the teams will be asked to indicate whether they want to play the short or long version of TEMPO. When they have provided their response the teams will receive some introductory remarks including the current force structure and budget for the first year, estimated budgets for the rext two years and the probability of war. Proposed research and development

programs for the first year are also displayed. This information is available at any time during the game so there is no need to record it.

when the teams have had sufficient time to review the initial data the umpire will signal the beginning of the game. To initiate play the teams press the carriage return keys at their respective stations and the game commences.

IMPORTANT! Since timing is critical to this implementation of TEMPO it is imperative that the teams wait for the umpire's signal to begin.

The rext display to appear on the screens is a menu of options available for the teams to choose from. These menu iters will be described in detail in the following paragraphs. NOTE: The menu items may be reselected as often as desired during each year.

#### 3. CURRENT FORCE STATUS AND DATA

This segment of the program provides a surmary of all systems in the current operating inventory. The table includes number of systems in operation, acquisition cost, operating cost and utility of each system. The purchase limit per year is also listed for the systems.

## 4. RESEARCH AND DEVELOPMENT DATA

The first display which appears when this option is selected shows which research and development (R&D) programs

are available for that particular year. The teams have only one year to begin work on a particular program. If they do not select the option they will not get the chance the next year. There is one exception to this rule. The R&D required prior to a system modification can be done in any of the first three years.

New research programs are offered only in years one, two, and three of the game. Programs begun in these years may be continued to completion but no new programs will be started beyond year three.

The teams will be asked by the computer if they wish to see a complete R&D report for the year. This report provides estimates of acquisition cost, operation cost, utility and R&D costs for each evailable program. The teams will be told how long the development will take and what the expected R&D costs for the future years of the program will be. The current year R&D cost is actual, however, the second and third year costs (if the program takes that long) are only estimates and may increase or decrease depending on now the program progresses.

Finally, in this module, the teams are asked if they wish to spend funds for any of the programs. If the answer is yes a third display appears with a menu of candidate R&D programs. The actual and projected R&D costs are again shown along with a status report of ongoing programs. If the team has begun a project in a previous year they are

reminded to continue the funding or else jeapordize the delivery schedule. The teams do have the option to cease funding of a program after the first year of R&L has been completed and then resure the development in a later year.

Additional R&D information on a system will be available only if the team initially chooses to jursue the program.

## 5. CURRENT BUDGET LATA

This module provides each team with the total tudget figure for the year, the total cost of operating the force for the year, and a running total of dollars spent up to that point in the year. Budget estimates for the next two years are also provided. Actual allocations for future years may vary but the estimates can provide a basis for planning. The probabilities of war, as currently estimated, are provided in this module.

The teams are advised to keep a close account of financial status since overspending the budget results in a penalty assessed against the next year's budget.

### 6. BUY ADDITIONAL SYSTEMS

Selection of this option provides each tear with a list of all systems which are available for purchase. Included in the list are the acquisition costs, utility, and purchase limits for each system. The players simply choose which system they want and the computer will ask how many the team wants to buy. When that input is provided the players receive acknowledgement of the sale.

Systems bought in one year will not be operated until the next year. Consequently, no operation costs will be incurred and no utility will be gained until the following year.

A new system is available for purchase as soon as all the R&D has been selected and paid for. A team may acquire units of a new system during the last year of R&D (provided the R&D has been funded), or at any time thereafter. A team cannot lose its option to buy units of a system once it is in the inventory.

## 7. MODIFY SYSTEMS IN CURRENT INVENTORY

At certain points in the game the teams may be effered the opportunity to modify or upgrade weapon systems they have in their inventories. These modifications are not possible without developing the technology which goes into them. Therefore, the R&D for the modification must be funded before the modification can take place. This funding is provided through the R&D module described above.

when the modify option is selected the players will be offered candidate systems for upgrade. There are two ways a system can be modified. It can be withdrawn from operations for the year, thus incurring no operation costs and providing no utility. Or it can be operated at the unmodified levels until the next year when the modification is complete and it automatically assumes the upgraded levels. The teams must choose how many units they want to

modify and how they want to distribute the way they are rodified. The computer will provide the necessary advisories.

To purchase uperaded systems directly, that is, other than upgrading systems already in the inventory, it is still necessary to pay the modification R&D cost (if it has not been paid). The new units can be purchased at a price equal to the procurement cost of the unmodified system plus the modification cost. This option will automatically be made available to the teams through the BUY module when the modification R&D is completed.

Modifications may be made at any rate not exceeding the purchase limit of the original system. R&D for the modifications may be performed at any time during the first three years of the game.

# E. SCRAP SYSTEMS IN CURRENT INVENTORY

It may be necessary at certain junctures of the game to get rid of older, less-efficient systems in order to free up their operations costs for other purposes. This can be done by selecting the SCRAP menu choice. A complete list of systems in the current inventory is displayed and the team is asked which system they would like to scrap. They are then asked how many units they would like to take out of operation and the computer acknowledges the entry. Force units scrapped in one year will remain in the inventory until the following year.

#### 9. BUY INTELLIGENCE DATA OR COUNTERINTELLIGENCE

Selection of this module provides the team with a menu of ten options for intelligence gathering. For \$122 each the team can get a report of the opponent's:

- a) current force structure of offensive forces, or
- t' current force structure of defensive forces, or
- c) current RSD programs for offensive systems, or
- d) current R&D programs for defensive systems.

  Intelligence reports on force structure do not provide an exact count of enemy systems. Rather, they present a tenunit range for each system, e.g. "SYSTEM-A has 22-29 units" is the report if the opponent has 22 units.

RSD intelligence reports list all programs for which RSI funds were expended that year by the enemy.

Either team may purchase counterintelligence in any of the four areas described above for \$50 per category. Counterintelligence reports inform the team if the enemy has purchased intelligence in that category during the year.

The intelligence menu provides the option to cancel all orders for intelligence and start over again for the year.

If an intelligence report is requested it will be presented automatically at the beginning of the following year's planning period.

Intelligence reports cannot be obtained in years five through eight.

### 12. PERFORM TRADE-OFF ANALYSES

This module may be selected any time during years one—through—four to assist in making decisions as to which systems to buy. The analysis—option—provides—a complete list of systems which are, or could be, available at that time for produrement or RSD. The team is asked to select two systems to be compared and an immediate analysis is presented. The report includes year-by-year life-cycle-cost breakouts for each system in the trade-off as well as yearly utility figures. Totals for both of these parameters are tabulated—and used to compute—a util/dollar cost effectiveness factor. This value is simply the total life cycle utility divided by the total life-cycle cost.

The teams will not be prevented from performing tradeoffs using systems they may have chosen not to R&D. This kind of analysis is not very useful, however, since the preferred option may not be possible to obtain.

The cost of analysis is \$25 for each trade-off performed.

## 11. RECOVERY FROM ENTRY ERRORS

This module is merely a tutorial to explain how to change entries the teams may have made and then later reconsidered. It is not possible to recover from every entry error, particularly in the RSD module. A team cannot

un-start development of a new technological program. Yest input errors can be corrected, however.

## 12. SUBMIT COMPLETED PLANNING AND BUDGETING

when the team has completed all of its actions and requests for the year, the final selection on the menu is entered. NOTE: Each team is given a specific time to use for current and long-term planning. It is strongly recommended that the teams take full advantage of their ellotted time to carefully prepare their plans. There is no advantage to an early submission of the yearly plan. The computer will simply make the team wait for the end of the period anyway. It should also be emphasized that a team is penalized for a late submission. Significant dellar reductions from the next year's budget are assessed for each minute the plan is late.

Upon selecting the year-end option from the menu, the tears are asked to confirm that they, indeed, are done for the year. At this point they have the option of returning to the main menu for subsequent adjustments.

When a confirmed entry is made, the year-end module performs several processes in closing out accounting for the year. The first report provided is a summary of utils provided by the weapon systems and dollars spent for the year. This report is immediately displayed at the team's terminal.

them to relar and collect themselves for the next planning exple. During the break, the unpire program is called up and each side's data is fed to a central point for recording and determination of the winner for the year. The umpire program also uses a random number generating routing to determine whether a war has occurred during the year. If a war has broken out, ressages to that effect are written into files and later retrieved by both sides. The activities of the unpire program are all transparent to the players of the game. Finally, the year-end routine updates the datacase for the coming year, and passes intelligence data back and forth between the red and blue sides.

When the program becomes active again, an introductory report for the next year will appear on the terminal screen. At this time, the intelligence reports which were requested during the previous year are also available simply by pressing the carriage return key on the terminal keyhoard. Following review of the intelligence reports, the teams receive the original menu and begin the process again for the next year.

### 13. WAR

Throughout the game there is a threat that war would break out in any year. The intelligence sources for each side will keep the teams informed of the best estimate of probability of an outbreak of hostilities for each year.

This information is provided at the beginning of each year and need not be requested or funded. It is also available in the EUDGET module at any time during the year.

If a war coopes, the cost in resources for each team will be reported to them and a winner will be declared. However, the overall winner of the game will be the team with the most net offensive utils for the entire eight-year game period.

### 14. PENALTIES

If a war occurs both teams will have \$400 out from the budget for next year. In addition, the loser's budget will be out by an amount equal to twice the difference between the two teams net offensive util count calculated for the year the war occurred.

If a team allocates more funds than it has in its budget during a given year, the budget in the following year will be reduced by twice the amount of the deficit. In addition, as soon as a team's expenditures (allocations plus operating costs) exceed the budget, the program will take it automatically to the year-end module. The team has the option of returning to the main menu. However, with each additional expenditure it will once again to sent to the year-end module. Advisories will be provided to explain what is happening but the awkwardness of this condition will presumably prevent significant overexpenditures.

If a budget is submitted late (that is, if the end-of-year menu selection is not made in the allotted time) the budget for the next year will be reduced by SE2 per minute for the first five minutes, and \$120 per minute for each minute over five minutes.

If a team does not spend its entire budget for the current year, the remainder of the funds are lost. There is no carryover to the following year.

### 15. WEAPON SYSTEM EFFECTIVENESS

The total utility of a given veapon system for one year is not simply the number of utils times the number of systems. The Law of Diminishing Marginal Returns postulates that stockpiling one particular weapon system which has a high utility does not insure success, nor does it support a balanced force concept. Therefore, the final util count for a system in a particular year may be reduced by some amount. The scheme for this util discount is shown in figure A-1. For example, if a team has 122 weapon systems, each with a utility of 55, the team will receive a total utility for that system of 4422 + 328 = 4722 rather than 6522.

### 16. DOCUMENTATION

Teams will be provided with blank budget allocation forms to assist them in planning where resources will be spent for the year. These forms need not be submitted at any time. They are merely tools to make the organization of the teams easier.

# FORCE UNIT UTIL DISCOUNT

Total utils of any individual force unit are discounted as follows:

TOTAL ORIGINAL UTILS 1 - 2000	FINAL NET UTIL VALUES original total
2001 - 3000	2000 plus 90% of amount over 2000
3001 - 4000	2900 plus 80% of amount over 3020
4021 - 5002	3700 plus 70% of amount over 4020
5201 - 6000	4420 plus 60% of arount over 5020
6201 - 7002	5000 plus 50% of amount over 6000
7001 - 8000	5500 plus 40% of amount over 7020
8001 - 9000	5920 plus 30% of amount over 8020
9001 - 10000	6200 plus 20% of amount over 9000
12001 - 11000	6400 plus 10% of amount over 12000
over 11000	6520 maximum net utils

Figure A-1. Utility Discount Scheme

Each year both teams receive an actual ludget for the current year plus estimated budgets for the next two years. These estimated budgets may change, but they can assist in making some long-range plans. The Multiple Year Defense Program (MYPP) is patterned after the Five Year Defense Program and is provided to help the teams formulate long-term force plans. The MYDP is merely a worksheet and will not be submitted.

Sample forms for the Eudget Allocation Form and the Fultiple Year Defense Plan are provided in figure 4-2 and figure 4-3, respectively.

#### 17. UMPIRE

The umpire has only one responsibility in the play of this version of TEMPC. He must signal the start of play when both teams have had the onance to review initial game data.

The umpire can also observe game status in terms of each team's utility totals for each year by logging into 'urrire' with password 'umpire' and examining the file "ump". This is a cumulative file which is updated at the end of each year. Note that the file must be recalled at the end of each year to receive the most current data. A file being displayed will not be automatically updated as it is teing viewed.
